EXP NO: 05
DATE : 27.8.26 Experiment on Capturing Tools :

WIRESHARK.

Aim:

To understand the features of Wireshark as a packet capture tool and analyze protocol encapsulation at various layers of a protocol stack.

Tools Required:

PC connected to LAN, Wireshark software.

Theory:

Wireshark is a passive network packet analyzer that capture network frames in real time. It breaks captured packets into three viewable panes:

* Packet List
* Packet Details
* Packet Bytes.

Procedure:

1. General Capture:

Open wireshark, select the active interface, set capture limit to 100 packets and click Start.

2. TCP / UDP Filter:

Type tcp (or) udp in the display filter bar, inspect headers and generate a Flow graph.

3. ARP Filters:

Type arp in the display filter bar to view address resolution requests and replies.

4. DNS Filter:

Type dns in the display filter bar to observe domain name queries and open the Flow graph.

5. HTTP Filter:

Type http in display filter bar to inspect web traffic.

6. IP/ICMP Filter:

Type icmp (or) ip in the display filter bar to view ping request/reply frames.

7. DHCP filter:

Type dhcp (or) bootp in the display filter bar to analyze IP lease packets
